

OBUYA · SHOP · ACADEMY · FOUNDATION · PARTNERSHIPS  
**Obuya GrassRoots Platform**

COMMERCIAL PROPOSAL & IMPLEMENTATION ROADMAP

# From a working store to Kenya's trusted sports marketplace

What has been built, what still has to be built, what each piece costs, and the difference between a basic launch and a secure production platform.

**~15k**

lines of TypeScript already written

**18**

billable modules on the roadmap

**3**

launch packages, Basic to Full Platform

Prepared

1 October 2026

Based on

A review of the *turborepotutorials* codebase (backend, storefront, admin), the *info/* design set, and the Obuya Platform Plan v2.0 / Design Review

Currency

USD, with KSh at 1 USD = 129 KSh (the rate the admin panel uses by default)

Validity

Prices valid for 30 days

# 1 Executive summary

Obuya already has a real foundation, not a mock-up: a branded storefront, a secured admin panel and a modern monorepo. To take payments from real customers safely, and to deliver the Academy, Foundation, Schools and Partnerships vision, a defined set of modules still has to be built. Each one is priced separately below.

## Where the project stands today

| Area                                       | Status    | What exists in the code                                                                                                                                       |
|--------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Architecture                               | BUILT     | Turborepo + pnpm monorepo: Express/TypeScript API, Next.js 16 storefront, separate admin/vendor app, shared @repo/database (MongoDB/Mongoose).                |
| Storefront                                 | BUILT     | Obuya GrassRoots branding, home, product page, gifts/crafts, cart, profile and addresses, Google sign-in, mobile bottom navigation.                           |
| Orders (basic)                             | BUILT     | Place order from cart, stock check, my orders, cancel order with stock restore, admin order list and status update.                                           |
| Admin security                             | BUILT     | Hidden admin URL, 3-step login (password → email OTP → Google Authenticator), HttpOnly cookie session, logout, rate limiting, superadmin-only admin creation. |
| Catalogue admin                            | BUILT     | Categories and products with Cloudinary image upload, inventory screens, dashboard with live stats.                                                           |
| Admin screens on demo data                 | UI ONLY   | Vendors, Customers, Quotations, Vendor Support, Analytics and currency settings look finished but run on generated demo data. They need backend APIs.         |
| Payments                                   | NOT SAFE  | A payment is recorded as “completed” from whatever the browser sends. There's no gateway verification, the currency is INR, and there's no M-Pesa.            |
| Vendor portal                              | NOT BUILT | adminvendor frontend is scaffolded and connected to the API, but it has a single placeholder page.                                                            |
| Academy, Foundation, Schools, Partnerships | NOT BUILT | Designed in Platform Plan v2.0, but no database models or screens exist yet.                                                                                  |

**The pitch in one line:** “You already own the foundation. These modules turn it into a platform that takes M-Pesa safely, onboards verified vendors, serves schools and academies, and is ready for auditors and investors.”

## Recommended path

**Step 1 · Secure Production**

Make what exists safe to take real money: M-Pesa, hardening, backups and monitoring. **4–6 weeks.**

**Step 2 · Marketplace**

Vendor portal, ledger and payouts, returns, notifications, real admin data. **Months 2–4.**

**Step 3 · Ecosystem**

Academy, Foundation, Schools/B2B, club partnerships. **Months 4–8+.**

## 2 Go-live blockers found in the code

These came from reading the current code. The first group are reasons the store must **not** take real payments yet. Each one is also a strong, honest reason for the client to buy the Secure Production package.

| #  | Issue                                                                                                                              | Severity | Business impact (how to explain it to the client)                                                  |
|----|------------------------------------------------------------------------------------------------------------------------------------|----------|----------------------------------------------------------------------------------------------------|
| 1  | Payment endpoint trusts the browser: POST /payment marks an order <i>paid</i> and <i>confirmed</i> with no gateway signature check | CRITICAL | Any logged-in user could mark their own order as paid without paying. This is direct revenue loss. |
| 2  | No M-Pesa / Airtel / card gateway. Code is wired for Razorpay and INR                                                              | CRITICAL | Kenyan customers can't pay in the way they actually pay.                                           |
| 3  | Stock is reduced in a loop with no database transaction or reservation                                                             | CRITICAL | Two buyers can get the last unit, which leads to oversold kits, refunds and angry parents.         |
| 4  | No security headers (Helmet), no input validation layer, a session secret fallback of 'fallback_secret'                            | HIGH     | This widens the attack surface. A misconfigured server would run with a guessable secret.          |
| 5  | Old Express 4.16 runtime, TypeScript strict: false, no automated tests, no backend linting, 42 frontend lint errors                | HIGH     | Bugs reach customers, every change is riskier, and maintenance costs more.                         |
| 6  | Email (SMTP) isn't configured. In production, admin login fails until it is                                                        | HIGH     | Admins are locked out on launch day, and there are no order confirmation emails.                   |
| 7  | No admin 2FA recovery codes. A lost phone needs a manual database edit                                                             | MEDIUM   | The business stalls when the owner loses their phone.                                              |
| 8  | Shipping hard-coded (free above 500, else 50). Order prefix still "MAMI-". No VAT/KRA eTIMS                                        | MEDIUM   | Wrong delivery charges, leftover branding on receipts, and not tax-compliant.                      |
| 9  | Five admin sections show demo data. Currency setting is saved per browser only                                                     | MEDIUM   | Admins could make decisions from fake numbers.                                                     |
| 10 | No backups, monitoring, error tracking, CI/CD or staging environment                                                               | HIGH     | A single server failure can lose every order. Outages are found by customers, not by the team.     |

**Sales framing:** Never present these as “the code is bad”. Present them as “*the prototype phase is complete; this is the production checklist every serious e-commerce platform goes through before it takes real money.*” The fix list is the product you're selling.

The Design Review (40 flaws: 10 critical, 18 high, 12 medium) and Platform Plan v2.0 already map every business-logic gap to a solution. The modules in section 5 implement that plan.

### 3 Launch packages

Three ways to go live. Anchor the conversation on the middle option: it's the one you want them to buy, and the Full Platform option makes it look reasonable.

#### Basic Launch

**\$1,800 – 2,500**

KSh 232k – 323k · 2–3 weeks

- Deploy the current store + admin to the cloud
- Domain, HTTPS, production env setup
- M-Pesa STK push (Daraja) with server-side verification
- Fix critical issue #1 (fake “paid” orders)
- SMTP email configured, branding clean-up (“MAMI-”)
- Free/low-tier hosting (shared DB, single server)
- 14 days of bug-fix support

For a soft launch or friends-and-family trial with low order volume. **Not recommended for public marketing.**

#### RECOMMENDED

#### Secure Production

**\$5,500 – 7,500**

KSh 710k – 968k · 4–6 weeks

- **Everything in Basic**, plus:
- M-Pesa + Airtel Money + card gateway, webhooks, daily reconciliation
- Order → PENDING\_PAYMENT → PAID flow with idempotency
- 15-minute stock reservation (no overselling)
- Security hardening: Helmet, validation, secrets vault, CSP, dependency upgrades
- Automated daily backups with a tested restore
- Monitoring, error tracking, uptime alerts
- CI/CD pipeline + separate staging site
- Admin 2FA recovery codes, audit log
- Privacy policy/consent capture (Kenya DPA 2019)
- 30 days of priority support

#### Full Platform

**\$32,000 – 48,000**

KSh 4.1M – 6.2M · 6–9 months, phased

- **Everything in Secure Production**, plus:
- Vendor portal, KYC, ledger, escrow, payouts
- Returns, refunds, exchanges, wallet
- Order state machine, courier tracking
- Promotions, reviews, vendor rating
- Academy: guardians, enrolments, bundles
- Foundation: donations, allocations, impact
- Schools/B2B: quotes, LPO, eTIMS invoices
- Club partnerships, analytics, PWA
- Billed per phase, as milestones are delivered

**Why the middle option sells:** Secure Production costs about 3× Basic and removes about 90% of the launch risk. A single week of fraudulent “paid” orders, or one lost database, costs more than the difference.

#### Discount levers (use these instead of cutting your rate)

- **Bundle discount:** 10% off if they sign Secure Production and a 6-month retainer together.
- **Phase commitment:** 7–8% off the Full Platform if all three phases are signed upfront (still paid per milestone).
- **Case-study credit:** 5% off in exchange for a testimonial and permission to use the project in your portfolio.

## 4 Basic upload vs secure production

This is the table to put in front of a client who asks “why can’t we just upload it?”

| Capability                    | Basic Launch                                                     | Secure Production                                                                                         |
|-------------------------------|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Hosting                       | One small server (Render/Railway free or \$7 tier), or a \$6 VPS | Managed containers with auto-restart, separate staging, CDN (Cloudflare) in front                         |
| Database                      | MongoDB Atlas M0 (free, shared, 512 MB, <b>no backups</b> )      | Atlas M10+ dedicated, encrypted, point-in-time restore, IP allow-list                                     |
| Backups                       | None, or manual                                                  | <b>Daily automatic + monthly restore test</b>                                                             |
| Payments                      | M-Pesa STK push, verified on server                              | M-Pesa + Airtel + cards (hosted fields, out of PCI scope), webhooks, idempotency keys, reconciliation job |
| Overselling protection        | Basic stock check only                                           | <b>Atomic reservation with 15-min expiry</b>                                                              |
| HTTPS / SSL                   | <b>Yes (free Let’s Encrypt)</b>                                  | <b>Yes + HSTS + strict cookie policy</b>                                                                  |
| Firewall / DDoS               | No                                                               | <b>Cloudflare WAF, bot rules, rate limits on all public APIs</b>                                          |
| Security headers & validation | No                                                               | <b>Helmet, CSP, schema validation on every endpoint</b>                                                   |
| Secrets                       | .env file on the server                                          | Secret manager, rotated keys, no fallbacks                                                                |
| Admin access                  | 3-step login (already built)                                     | + recovery codes, audit log of every price/stock/refund change, IP alerts                                 |
| Monitoring                    | Customers report outages                                         | <b>Sentry error tracking, uptime pings, alerts by SMS/email</b>                                           |
| Deployments                   | Manual upload                                                    | CI/CD: tests + type-check + lint must pass, one-click rollback                                            |
| Testing                       | Manual                                                           | Automated tests on checkout, payment and auth                                                             |
| Legal / compliance            | Not covered                                                      | <b>Privacy policy, consent records, ODPC readiness (Kenya Data Protection Act)</b>                        |
| Expected uptime               | ~97–99% (best effort)                                            | 99.5–99.9% with alerting                                                                                  |
| Monthly running cost          | <b>\$15 – 45</b>                                                 | <b>\$160 – 380</b>                                                                                        |
| One-time build price          | <b>\$1,800 – 2,500</b>                                           | <b>\$5,500 – 7,500</b>                                                                                    |

“Basic gets you online. Secure Production keeps you online, keeps the money you earn, and keeps you out of trouble with the Data Commissioner.”

## 5 À-la-carte module price list

Every future feature, sized from the code review and Platform Plan v2.0. The day estimates assume one experienced full-stack developer. Price ranges allow for scope clarification. Quote the low end for a tightly scoped version, and the high end when the client wants every v2.0 detail.

| #                                             | Module                               | What's included                                                                                                                          | Days  | Price (USD)     | KSh         |
|-----------------------------------------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|-------|-----------------|-------------|
| Phase 1: Trustworthy marketplace (Months 0–4) |                                      |                                                                                                                                          |       |                 |             |
| 1                                             | Payments: M-Pesa, Airtel, cards      | Daraja STK push, card gateway (Pesapal/Flutterwave/Paystack), webhooks, status-query fallback, daily reconciliation, retry/switch method | 9–12  | \$2,000 – 2,800 | 258k – 361k |
| 2                                             | Checkout hardening                   | PENDING_PAYMENT orders, 15-min stock reservation, idempotency keys, DB transactions, guest checkout, price snapshot                      | 5–7   | \$1,100 – 1,600 | 142k – 206k |
| 3                                             | Shipping, VAT & eTIMS                | Shipping zones and rates per vendor, VAT rules, KRA eTIMS e-invoice integration                                                          | 6–9   | \$1,300 – 2,000 | 168k – 258k |
| 4                                             | Order state machine & delivery       | Strict statuses with history, vendor sub-orders, SLA timers, courier integration and tracking, failed/lost delivery flows                | 8–11  | \$1,800 – 2,500 | 232k – 323k |
| 5                                             | Returns, refunds, exchanges & wallet | Platform return policy, auto-approval, vendor 48 h window, disputes queue, refund to M-Pesa/card, store-credit wallet, exchanges         | 7–10  | \$1,600 – 2,300 | 206k – 297k |
| 6                                             | Vendor portal (adminvendorfrontend)  | Vendor sign-up, KYC upload (KRA PIN, CR12, ID), staff logins and roles, own products, stock, orders, dispatch, payout statements         | 14–20 | \$3,200 – 4,800 | 413k – 619k |
| 7                                             | Commission ledger, escrow & payouts  | Commission rules per category, append-only vendor ledger, release after return window, weekly M-Pesa B2C/bank payouts, 10% reserve       | 9–12  | \$2,000 – 2,900 | 258k – 374k |
| 8                                             | Connect admin screens to real data   | Backend APIs for Vendors, Customers, Quotations, Vendor Support (tickets), Analytics, shared currency settings                           | 9–13  | \$2,000 – 3,000 | 258k – 387k |

| <b>Phase 2: Academy, Foundation and Schools (Months 4–8)</b> |                                              |                                                                                                                                                                   |                |                          |                      |
| 13                                                           | <b>Obuya Academy</b>                         | Guardian accounts with child profiles, programmes and enrolments, member pricing (non-shareable), spending caps, coach-curated bundles with substitutes           | 13–18          | \$3,000 – 4,300          | 387k – 555k          |
| 14                                                           | <b>Obuya Foundation</b>                      | Needs list, donation lines in cart, Kit Credit, donation receipts, foundation stock, allocations, anonymised impact reports, safeguarding controls, private media | 11–16          | \$2,600 – 3,800          | 335k – 490k          |
| 15                                                           | <b>Schools &amp; B2B procurement</b>         | Organisations and roles (coach requests, bursar approves), quotes, pro-forma, LPO upload, credit terms, invoices on account, termly re-orders, hub fulfilment     | 15–22          | \$3,500 – 5,200          | 452k – 671k          |
| <b>Phase 3: Partnerships and growth (Months 8+)</b>          |                                              |                                                                                                                                                                   |                |                          |                      |
| 16                                                           | <b>Club partnerships &amp; ad placements</b> | Tiered partner contracts, category sponsorship, homepage placements, licensed merchandise, performance tracking                                                   | 7–10           | \$1,500 – 2,300          | 194k – 297k          |
| 17                                                           | <b>Mobile PWA &amp; performance</b>          | Installable app, offline order tracking, image compression, low-data mode, SEO and Core Web Vitals                                                                | 4–7            | \$900 – 1,600            | 116k – 206k          |
| 18                                                           | <b>AI support assistant</b>                  | 24/7 chatbot for order status, returns and sizing, handing off to a human (WhatsApp). Usage billed separately                                                     | 5–9            | \$1,200 – 2,200          | 155k – 284k          |
| <b>Total, all modules</b>                                    |                                              | <b>Before package or bundle discounts</b>                                                                                                                         | <b>140–202</b> | <b>\$31,600 – 47,200</b> | <b>4.08M – 6.09M</b> |

Optional add-ons: international multi-currency selling (\$1,500–2,500), native Android app via React Native (\$6,000–10,000), data migration from spreadsheets (\$300–800), admin training session (\$150 per half day).

## 6 Monthly running costs

These are third-party bills the client pays directly (or you pass them through with a 10–15% management fee). Show this table early so nobody is surprised later.

| Service                   | Basic                             | USD/mo           | Secure Production                                   | USD/mo             |
|---------------------------|-----------------------------------|------------------|-----------------------------------------------------|--------------------|
| Backend API hosting       | Render/Railway starter or \$6 VPS | 0 – 7            | 2 instances + staging (Render/Railway/DigitalOcean) | 40 – 90            |
| Frontends (store + admin) | Vercel Hobby / same VPS           | 0                | Vercel Pro (commercial use)                         | 20 – 40            |
| Database                  | MongoDB Atlas M0 (free)           | 0                | Atlas M10 dedicated + backups                       | 60 – 90            |
| Images (Cloudinary)       | Free plan                         | 0                | Plus plan                                           | 0 – 99             |
| CDN / firewall            | Cloudflare free                   | 0                | Cloudflare Pro (WAF rules)                          | 20 – 25            |
| Email                     | Gmail SMTP / Brevo free           | 0 – 10           | Business mailboxes + transactional (SES/Brevo)      | 10 – 25            |
| SMS / WhatsApp            | Pay-as-you-go                     | 5 – 20           | Africa's Talking SMS + WhatsApp Business API        | 20 – 60            |
| Monitoring                | None                              | 0                | Sentry Team + uptime monitor                        | 0 – 30             |
| Domain                    | .co.ke / .com                     | ~1               | Same                                                | ~1                 |
| <b>Total</b>              |                                   | <b>\$15 – 45</b> |                                                     | <b>\$160 – 380</b> |

**Transaction fees (not hosting):** M-Pesa Paybill/Till and card gateways charge per transaction, typically 1.5–3.5% for cards and a tiered fee for M-Pesa. Build these into the commission model (Module 7) so Obuya's margin is protected.

### Assumptions behind these prices

- Blended developer rate of about \$30–35/hr (about KSh 4,000–4,500/hr), with a 15–20% buffer for testing, review and project management.
- The client supplies third-party accounts and credentials (Daraja, gateways, KRA, Cloudinary, domains) and pays their fees directly.
- Designs follow the existing UI style. A full rebrand or new design system is quoted separately.
- Legal texts (terms, privacy policy, safeguarding policy) are templates. Review by a Kenyan advocate is the client's responsibility, as Platform Plan v2.0 already states.
- Adjust every figure to your actual rate and market. The relative sizes of the modules stay valid either way.

## 7 Roadmap, milestones & payment terms

| Phase                 | Timeline   | Deliverables                                                                                                                                  | Investment        |
|-----------------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| 0 • Secure Production | Weeks 1–6  | Payments (M-Pesa first), checkout hardening, security hardening, backups, CI/CD, staging, monitoring, compliance basics                       | \$5,500 – 7,500   |
| 1 • Marketplace       | Months 2–4 | Modules 3–11: shipping/VAT, state machine, returns/wallet, vendor portal, ledger/payouts, real admin data, notifications, promotions, reviews | \$15,000 – 22,000 |
| 2 • Ecosystem         | Months 4–8 | Modules 13–15: Academy, Foundation, Schools/B2B                                                                                               | \$9,100 – 13,300  |
| 3 • Growth            | Months 8+  | Modules 16–18: partnerships, PWA, AI support                                                                                                  | \$3,600 – 6,100   |

Phase totals overlap with the module list because Secure Production already contains Modules 1, 2 and 12.

### Payment terms (protect your cash flow)

- **40% upfront** to book the slot, **40%** on staging demo/UAT, **20%** on go-live. For the Full Platform, use the same split *per phase*.
- Payment in USD by wire/Wise/Payoneer, or KSh via M-Pesa/bank at the rate on the invoice date.
- Work pauses if an invoice is more than 10 days overdue. Source code and IP transfer on final payment.
- **Scope control:** anything not listed in the signed module description is a change request, quoted at \$35/hr before work starts.
- **Warranty:** 30 days of free fixes for defects in delivered scope (not new features).
- The client provides: M-Pesa Paybill/Till and Daraja credentials, gateway merchant account, KRA PIN for eTIMS, content and product data, and timely UAT feedback (within 5 business days).

### Acceptance criteria (this builds trust)

Every module ships with written acceptance tests taken from the Design Review flaw IDs. For example: “A refund for F18 goes back to the original M-Pesa number”, or “Two customers can’t buy the last unit (F05)”. The client signs off against a checklist, not a feeling.

## 8 Maintenance & support retainers

This is recurring revenue for you. Software that handles money needs ongoing care, so sell the retainer with every build.

### Care

**\$250** /month

- Security patches & dependency updates
- Uptime monitoring
- Bug fixes up to 5 hrs/mo
- Response within 2 business days

### BEST VALUE

### Growth

**\$650** /month

- Everything in Care
- 15 hrs/mo for fixes or small features
- Monthly backup restore test
- Monthly performance & sales report
- Response within 8 working hours

### Partner

**\$1,300** /month

- Everything in Growth
- 35 hrs/mo of development
- Priority incident response (2 hrs)
- Quarterly security review
- Roadmap & strategy call

Hours outside the retainer, and change requests: \$35/hr. Unused hours don't roll over (or allow one month of roll-over as a goodwill gesture). 6-month minimum term. Hosting bills are separate.

## 9 Sales playbook: selling points

How to position each package so the client sees an investment, not a cost.

### “Your money is safe”

Server-verified M-Pesa and card payments, idempotent webhooks and daily reconciliation. *Every shilling paid is matched to an order.*

### “Never oversell a kit again”

Real-time stock reservation means two parents can never buy the last pair of size-5 boots.

### “Built for Kenya”

KSh pricing, M-Pesa/Airtel first, eTIMS invoices, SMS/WhatsApp updates, mobile-first and light on data.

### “Bank-grade admin security”

Hidden admin URL, password + email OTP + Google Authenticator, lockouts and audit logs. *This is already built, so show it in a live demo.*

### “A marketplace that runs itself”

Vendor KYC, automatic commission, escrow and weekly payouts. Obuya earns on every sale without handling stock.

### “Schools buy the way schools buy”

Quotes, pro-forma for tenders, LPO, credit terms and termly re-orders. This opens the high-value institutional channel.

### “Transparent giving”

Foundation donations with receipts, needs lists and anonymised impact reports, so donors and sponsors can trust the impact.

### “Investor and audit ready”

Ledgers, audit trails, consent records and real analytics. These are the numbers a funder or club partner will ask for.

## Value framing: tie price to their revenue

- **Commission math:** “At 12% commission, KSh 8M of vendor sales a year returns about KSh 960k, which pays for the whole Secure Production package in year one.”
- **Cost of not fixing:** “One fake-paid order a day at an average KSh 4,000 is KSh 1.4M lost a year. The payment fix costs a fraction of that.”
- **School channel:** “One school kit order (40 kits × KSh 3,500) is KSh 140k. Ten schools a term pays for the B2B module several times over.”
- **Downtime:** “Without backups, one database failure loses every order and customer record. The backup and monitoring setup costs less than a month of rent.”

## 10 Handling objections & upselling

| Client says...                                   | You say...                                                                                                                                                                                                                                                |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| "It already works. Why can't we just upload it?" | "It works as a demo. Before it takes real money it needs payment verification, backups and stock locking. I'll show you the exact line that would let someone mark an unpaid order as paid. Basic gets you online; Secure Production keeps your revenue." |
| "It's too expensive."                            | "Let's phase it. Secure Production now, and the marketplace modules funded by the sales it brings in. We pay per milestone, so you only pay for what's delivered and approved."                                                                           |
| "Another developer quoted less."                 | "Ask whether their quote includes webhook verification, reconciliation, backups, staging and the Kenya Data Protection Act. Mine is itemised against 40 documented design flaws, with acceptance tests for each."                                         |
| "Can we skip security for now?"                  | "Admin security is already done, and that's the hardest part. The rest is about 2 weeks of work that protects every future shilling. A breach involving children's data (Academy/Foundation) is a legal matter, not just a technical one."                |
| "We'll maintain it ourselves."                   | "Sure. I'll hand over docs and CI/CD. Payment APIs, M-Pesa certificates and security patches change often, though, and the Care plan at \$250/month costs less than one emergency fix."                                                                   |
| "Can you just do Academy first?"                 | "Academy depends on payments, checkout and guardian consent. Building it on an unsafe checkout would mean rebuilding it later. Phase 0 is the foundation that every module uses."                                                                         |

### The upsell ladder

| # | After they buy...  | Offer next                                                                                 | Typical value       |
|---|--------------------|--------------------------------------------------------------------------------------------|---------------------|
| 1 | Basic Launch       | Upgrade to Secure Production (credit 100% of the Basic fee if they upgrade within 60 days) | +\$3,700 – 5,000    |
| 2 | Secure Production  | Growth retainer + Vendor portal & ledger (start earning commission)                        | +\$650/mo, +\$5,200 |
| 3 | Vendor marketplace | Promotions, reviews & notifications to increase conversion                                 | +\$3,000 – 4,500    |
| 4 | Marketplace live   | Schools/B2B, the highest-ticket channel                                                    | +\$3,500 – 5,200    |
| 5 | B2B live           | Academy + Foundation, which deliver the brand mission                                      | +\$5,600 – 8,100    |
| 6 | Everything live    | Club partnerships, PWA, AI assistant, native app                                           | +\$3,600 – 16,000   |

**Closing line:** "The design is done, the foundation is built and the admin is already locked down. Give me six weeks and Obuya takes M-Pesa payments safely. Six months after that, it's the platform in your Plan v2.0. Which start date works for you: the 1st or the 15th?"
