

Design Review: Flaws & How to Overcome Them

An independent review of the 12 Obuya website and platform design documents by a three-member Claude council. Each flaw is shown next to its fix.

Date	Scope	Companion document
15 September 2026	info/ design set (flows, business logic, ERD, DFD, partnerships)	Obuya Platform Plan v2.0: Final Improved Version

0 How this review was run

C1 Data & Architecture

ERD, DFD, inventory, state and consistency of the data model

Contributed to **21** of the 40 final flaws

C2 Business, Finance & Compliance

Pricing, payments, payouts, partnerships, Kenyan law and governance

Contributed to **21** of the 40 final flaws

C3 Journeys, UX & Operations

End-to-end customer, vendor, school and donor journeys; cross-document consistency

Contributed to **24** of the 40 final flaws

Each council member reviewed all 12 documents independently, through its own lens. Together they reported 60 findings. The chair merged duplicates, so a flaw found by several members appears once and lists all of them under "Raised by". The result is 40 distinct flaws, each with a severity rating. Severity measures impact if the platform were built as designed: **CRITICAL** means money, legal or data-integrity failure; **HIGH** means serious customer, vendor or operational harm; **MEDIUM** means inconsistency, rework or lower trust.

AREA	CRITICAL	HIGH	MEDIUM	TOTAL
A · Consistency & Market Scope	1	1	1	3
B · Checkout, Pricing & Payments	3	4	1	8
C · Orders, Fulfilment & Delivery	1	3	2	6
D · Returns & Refunds	1	2	1	4
E · Vendors & Marketplace Integrity	–	5	1	6
F · Obuya Academy	1	–	1	2
G · Obuya Foundation	3	–	–	3
H · Schools & Club Partnerships	–	2	2	4
I · Platform, Data & Governance	–	1	3	4
All areas	10	18	12	40

Documents reviewed: TotalFlow.png, Flow.png, Flow_academy.png, foundation_link.png, schools.png, Partnership_Football.png, BusinessLogic_Shop.png, database_shop.png, DFD2.png, CouponsPromotionsetc.png, InventoryManagement_flow.png, VendorPefomance.png

The critical flaws to fix before building

1. **F02** Documents disagree on who packs and ships
2. **F04** Payment comes before the order, and the payment flow is disconnected
3. **F05** No stock reservation, so the last unit can sell twice
4. **F06** Price is only calculated at checkout
5. **F12** No way to cancel an order
6. **F18** Refunds only as expiring coupons
7. **F28** Academy flow has no data model and its discount can be abused
8. **F30** Foundation purchases can't be recorded
9. **F31** No governance for donation money
10. **F32** Children's photos and data collected without safeguards

Note on legal references. Laws and regulators are named (Consumer Protection Act 2012, Data Protection Act 2019 / ODPC, Anti-Counterfeit Act 2008, PPADA 2015, KRA eTIMS, Competition Authority of Kenya) to flag risk areas. They are not legal advice. Confirm each point with a Kenyan advocate before launch.

A Consistency & Market Scope

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F01 HIGH Two markets mixed in one design The shop and academy mockups use ₹ (INR), an India address, UPI and Net Banking, while the Foundation and schools material is built around Kenya (KSh, M-Pesa). Nothing states the launch market, the base currency, the payment gateway or which country's laws apply. ORDERS stores no currency or exchange rate. Source: Flow.png, Flow_academy.png, foundation_link.png, schools.png · Raised by: C2, C3	→ REMEDY - Pick one launch market: Kenya, with KSh as the base currency and M-Pesa, Airtel Money and cards as payment methods. - Store currency and fx_rate on ORDERS and ORDER_ITEMS, and give each region its own price list. - Redraw every mockup in KSh. Label international selling as a later phase. Implemented in Plan v2.0: §1 Foundational decisions
F02 CRITICAL Documents disagree on who packs and ships TotalFlow says Obuya does 'Quality Check & Packing'. Every other document says the vendor packs and hands the parcel straight to the courier. Those are two different businesses, with different costs, warehouses, SLAs and liability, and the design never picks one. Source: TotalFlow.png vs Flow.png, BusinessLogic_Shop.png, VendorPefromance.png · Raised by: C3	→ REMEDY - Define two fulfilment modes. MARKETPLACE_DIRECT: the vendor ships. OBUYA_HUB: Obuya checks and packs. - Send marketplace retail orders direct. Send Foundation, school and Obuya-brand orders through the hub. - Store fulfilment_mode on every vendor sub-order and draw all flows from it. Implemented in Plan v2.0: §1 Foundational decisions · §7 Obuya Foundation · §8 Schools and club partnerships
F03 MEDIUM Sports list, school steps and terms don't match The sports list is Cricket/Football/Tennis in one document, Cricket/Football/Rugby in another and Cricket/Football/Basketball in a third. The school journey has 6 steps in schools.png and 5 differently named steps elsewhere. Developers and designers will build different things. Source: Flow.png, DFD2.png, foundation_link.png, schools.png, TotalFlow.png · Raised by: C3	→ REMEDY - Keep one master reference sheet: the sports list (admin-managed data, not hard-coded), the school journey steps, status names and a glossary. - Redraw every diagram from that sheet and put a version number on each document. Implemented in Plan v2.0: §1 Foundational decisions · §8 Schools and club partnerships

B Checkout, Pricing & Payments

× THE FLAW IN THE CURRENT DESIGN

F04 CRITICAL

Payment comes before the order, and the payment flow is disconnected

The rules say 'payment must succeed before an order is created', but `PAYMENTS.order_id` needs an order to exist. If payment succeeds and order creation fails, the customer is charged with no order. In DFD2, Place Order, Payment Gateway, Payment Status and Payment Failed are boxes with no connections. M-Pesa STK timeouts and late callbacks aren't handled.

Source: `BusinessLogic_Shop.png §4 & Rule 4, DFD2.png, database_shop.png` · **Raised by:** C1, C2, C3

✓ HOW TO OVERCOME IT

→ REMEDY

- Create the order first as `PENDING_PAYMENT`, then open a payment intent linked to it.
- Confirm the order through an idempotent gateway webhook, backed by a status query. Unpaid orders expire after 15 minutes.
- If payment fails, keep the cart and offer one-tap retry or a different method.

Implemented in Plan v2.0: §2 Improved customer checkout · §9 Trust, compliance and operations

F05 CRITICAL

No stock reservation, so the last unit can sell twice

One document reduces stock when the order is placed, another after payment. Nothing holds stock while an M-Pesa payment is pending, so two buyers can pay for the last unit. `INVENTORY.reserved_qty` exists but no flow uses it.

Source: `InventoryManagement_flow.png, BusinessLogic_Shop.png §4, database_shop.png` · **Raised by:** C1, C3

→ REMEDY

- Reserve stock atomically when checkout starts (only if `available ≥ qty`) and log it as `RESERVE`.
- Change it to `SALE` when payment succeeds. `RELEASE` it on failure or after the 15-minute timeout.
- Show 'only X left' from `quantity – reserved_qty`.

Implemented in Plan v2.0: §2 Improved customer checkout · §5 Vendor programme

F06 CRITICAL

Price is only calculated at checkout

The product page shows a price, but the country is only captured at checkout, and only then does DFD2 run 'Determine Product Price'. The total can change at the last step, and coupon minimums get checked against the wrong figure. The schema has only `base_price` and `sale_price`, with nowhere to store country prices.

Source: `Flow.png steps 4 & 6 and Key Notes, DFD2.png, database_shop.png` · **Raised by:** C1, C3

→ REMEDY

- Detect the country at session start (IP address, confirmed with a picker in the header) and show local prices from the first page.
- Add `PRICE_LISTS` and `PRICE_LIST_ITEMS` (cost, vendor margin, platform margin, sell price per region).
- Save a price snapshot on each order line. If the price changes, show a clear 'price updated' notice in the cart.

Implemented in Plan v2.0: §2 Improved customer checkout

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F07 HIGH 'Higher margins for richer countries' pricing Pricing by the visitor's detected country is easy to get around with a VPN or a parcel forwarding service. Openly charging 'richer countries' more also invites bad press, and in some markets (such as the EU) raises fair-pricing concerns. Source: Flow.png Key Notes, DFD2.png (Regional / Market-Based Pricing) · Raised by: C2	→ REMEDY • Set price by shipping destination and lock it at checkout, not by IP address. • Show the full landed cost (product, shipping, duties) and explain regional price differences as logistics and duty costs. Implemented in Plan v2.0: §1 Foundational decisions · §2 Improved customer checkout
F08 HIGH Coupon checked too early, with double-spend risk The coupon is applied before the address, regional price and shipping are known, so a valid coupon can become invalid later. Usage is checked and then updated in a separate step, so one code can be used several times in parallel. PROMOTIONS and COUPONS both hold the rules, and there's no per-user limit or stacking priority. Source: BusinessLogic_Shop.png §1 & §5, DFD2.png, database_shop.png · Raised by: C1, C3	→ REMEDY • Order checkout as: address → price → shipping → tax → coupon → payment. Re-check the coupon whenever the cart or address changes. • Redeem inside the order transaction (usage_count < usage_limit), with a UNIQUE(coupon_id, order_id) constraint. • Keep the rules only on PROMOTIONS, and add per_user_limit, stackable and priority. Implemented in Plan v2.0: §2 Improved customer checkout · §6 Obuya Academy
F09 HIGH No model for tax, VAT, duties or shipping rates Kenya charges 16% VAT and uses KRA eTIMS e-invoicing. Cross-border sales also bring destination VAT, duties and the question of who is importer of record. None of this is designed. The schema has no shipping zone, shipping rate or tax tables, and ORDERS holds a single shipping_amount even though each vendor ships separately. Source: Flow.png ('Global Shipping', 'taxes if any'), DFD2.png, database_shop.png · Raised by: C1, C2	→ REMEDY • Add SHIPPING_ZONES, SHIPPING_RATES and TAX_RULES. Store tax_amount on each order line and shipping on each vendor sub-order. • Integrate KRA eTIMS. Launch domestic/EAC only, and add international shipping later through a consolidated DDP forwarder. Implemented in Plan v2.0: §2 Improved customer checkout · §8 Schools and club partnerships

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F10 HIGH Nobody decides who pays for discounts or how they split One payment covers several vendors, but nothing says how an order-level coupon or shipping charge is split between them, who funds the discount (Obuya or the vendor), how it affects commission, or how much to refund when only one item comes back. Stacked promotions can push an order below cost. Source: BusinessLogic_Shop.png, CouponsPromotionsetc.png, database_shop.png · Raised by: C1, C2, C3	→ REMEDY - At order creation, split order-level discounts and shipping across order lines in proportion to value, and store the split. - Add funded_by (platform / vendor / shared) to promotions, and enforce a maximum discount or minimum margin per order. - Refunds are per item and capped at the amount actually paid for that line. Implemented in Plan v2.0: §2 Improved customer checkout · §4 Returns, refunds and exchanges · §5 Vendor programme · §8 Schools and club partnerships
F11 MEDIUM Card data handling (PCI scope) not defined The checkout mockup shows card fields on Obuya's own page. That could put the platform in full PCI-DSS scope, and there is no settlement reconciliation. Source: Flow.png checkout mock-up, BusinessLogic_Shop.png · Raised by: C2	→ REMEDY - Use hosted or tokenised gateway fields (for example Pesapal, Flutterwave or Stripe Elements), which keeps Obuya at the simplest PCI level (SAQ-A). - Run a daily settlement reconciliation job against gateway and M-Pesa statements. Implemented in Plan v2.0: §2 Improved customer checkout

C Orders, Fulfilment & Delivery

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F12 CRITICAL No way to cancel an order No document lets a customer cancel before dispatch, a vendor reject an order it can't fill, or an admin cancel for fraud. The only exit is a return after delivery, which costs everyone two shipments. Source: Flow.png, BusinessLogic_Shop.png, VendorPefromance.png · Raised by: C3	→ REMEDY - Customers can cancel any vendor sub-order until the courier picks it up, with an automatic refund and stock released. - A vendor can reject an order (out of stock), but it counts against their rating. Admins can cancel for fraud. Implemented in Plan v2.0: §3 Order lifecycle, cancellation and delivery exceptions

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F13 HIGH One order becomes many unexplained parcels A cart with items from several vendors silently becomes several sub-orders, each with its own tracking number, delivery date, return decision and review request. The customer placed one order and receives a stream of messages they can't connect. Source: BusinessLogic_Shop.png §4, database_shop.png, Flow.png · Raised by: C3	→ REMEDY - Group the cart by package (vendor) before payment, with a delivery estimate and shipping cost for each group. - Show one order page with a timeline for each package, and merge notifications into one digest. Implemented in Plan v2.0: §2 Improved customer checkout
F14 HIGH Missing the 2-day dispatch rule doesn't affect the customer A late dispatch only lowers the vendor's rating. The customer gets no alert, no new date, and no option to cancel or have the order moved to another vendor. Source: VendorPefromance.png, BusinessLogic_Shop.png §6 · Raised by: C3	→ REMEDY - When the dispatch deadline passes, notify the customer with a new date and a one-tap cancel. - Two business days after that, auto-cancel and refund, or reassign to another vendor with stock. Flag the late vendor. Implemented in Plan v2.0: §3 Order lifecycle, cancellation and delivery exceptions
F15 HIGH Failed, lost or damaged deliveries not handled Delivery goes straight to 'Delivered'. There's no path for a customer who isn't home, a wrong address, a parcel sent back to the vendor, or a lost or damaged parcel, and no claim against the courier. Source: BusinessLogic_Shop.png §7, Flow.png steps 10–11 · Raised by: C3	→ REMEDY - Add exception states: DELIVERY_FAILED → RETRY (max 2) → RETURNING_TO_VENDOR, plus LOST and DAMAGED. - Give the customer 24 hours to fix the address, refund automatically once the returned parcel arrives, and file claims against the courier or vendor. Implemented in Plan v2.0: §3 Order lifecycle, cancellation and delivery exceptions
F16 MEDIUM Order statuses are free text, not a state machine order_status, item_status, vendor_order status, shipment status and return status are all unstructured text. There are no allowed transitions, no rule for the parent order's status when parcels arrive at different times, and no clear owner of 'Delivered'. Source: BusinessLogic_Shop.png §6–7, database_shop.png · Raised by: C1	→ REMEDY - Define enums and allowed transitions for each entity, and log every change to STATUS_HISTORY. - Derive the parent order's status from its sub-orders (for example PARTIALLY_SHIPPED). 'Delivered' comes from the courier webhook. Implemented in Plan v2.0: §3 Order lifecycle, cancellation and delivery exceptions

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F17 MEDIUM Guest checkout can't actually work Guests are allowed and CARTS.customer_id is nullable, but ORDERS.customer_id and address_id are required. Guest tracking, refund emails and merging the cart after login aren't designed. Source: BusinessLogic_Shop.png §1 (Registered/Guest), database_shop.png · Raised by: C1	→ REMEDY • Make ORDERS.customer_id nullable and add guest_email and guest_phone. Copy the address onto the order instead of linking to an editable address. • Merge the session cart into the account cart on login, and give guests a signed tracking link. Implemented in Plan v2.0: §2 Improved customer checkout

D Returns & Refunds

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F18 CRITICAL Refunds only as expiring coupons Every refund, even for a defective or wrong item, becomes a single-use 'Return Balance Coupon' that expires and needs a minimum order (the ₹500 example). That locks the customer's own money into store credit, conflicts with consumer-protection rules (such as Kenya's Consumer Protection Act 2012) and invites card or M-Pesa disputes. Two tables (COUPONS and RETURN_BALANCE_COUPONS) track the same balance. Source: BusinessLogic_Shop.png Rule 7 & Return Policy, CouponsPromotionsetc.png, database_shop.png · Raised by: C1, C2, C3	→ REMEDY • By default, refund to the original payment method (card refund or M-Pesa B2C reversal). • Offer store credit only as an opt-in choice, paid into a WALLET ledger with no minimum order and at least 24 months' validity. • Drop RETURN_BALANCE_COUPONS. A REFUND goes either to the payment method or to the wallet. Implemented in Plan v2.0: §4 Returns, refunds and exchanges
F19 HIGH Vendors decide their own returns The vendor decides whether to accept a return, which is a conflict of interest. The customer's only recourse is an admin grievance with no deadline. Customers see Obuya as the seller, so Obuya carries the legal and reputational risk anyway. Source: Flow.png step 13 & Key Notes, BusinessLogic_Shop.png §8 · Raised by: C2, C3	→ REMEDY • Publish one platform-wide return policy that vendors cannot override. • Auto-approve clear cases. Give vendors 48 hours to respond, after which the return is approved automatically. Admins decide disputes within 5 business days, and an overturned rejection counts against the vendor. Implemented in Plan v2.0: §2 Improved customer checkout · §4 Returns, refunds and exchanges

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F20 HIGH Exchanges promised but not designed Flow.png promises 'Returns / Exchanges', but the business logic only covers return-then-coupon. Swapping sizes, the most common case for boots and kit (especially for growing academy kids), has no flow. Source: Flow.png step 13 vs BusinessLogic_Shop.png §8, VendorPefromance.png review · Raised by: C3	→ REMEDY Add an exchange flow: choose a new size or variant, reserve that stock, and ship the replacement once the courier collects the return (or immediately for trusted customers). No extra payment if the price is the same. Implemented in Plan v2.0: §4 Returns, refunds and exchanges
F21 MEDIUM Return coupons wait on manual admin work The same flow calls the return coupon 'Automatically Generated' and then says 'Admin creates a unique coupon code'. If an admin has to do it by hand, every approved return waits in a queue. Source: CouponsPromotionsetc.png · Raised by: C3	→ REMEDY When a return is approved, the system issues the refund or credit immediately. Admins only handle exceptions and disputes, working from a queue with a response target. Implemented in Plan v2.0: §4 Returns, refunds and exchanges · §9 Trust, compliance and operations

E Vendors & Marketplace Integrity

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F22 HIGH 2-day dispatch rule is unfair and easy to fake The rule counts calendar days from the order date, ignoring weekends, holidays, late-night orders and made-to-order kits. Dispatch is 'proven' by a tracking number the vendor types in, which can be fake. dispatched_within_2_days is stored as a column and will drift from the actual dates. Source: VendorPefromance.png, BusinessLogic_Shop.png Rule 1 & §6, database_shop.png · Raised by: C1, C2, C3	→ REMEDY - Count business days from payment confirmation, with a 2 pm cutoff and a holiday calendar. Allow dispatch_sla_days per product (for example 7 days for custom kits). - Treat an item as dispatched only at the courier's first pickup scan (API/webhook). Calculate 'on time' from the dates instead of storing a flag. Implemented in Plan v2.0: §2 Improved customer checkout · §5 Vendor programme

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F23 MEDIUM Rating formula undefined and polluted by courier issues The five factors have no weights, time window or minimum number of orders, so a vendor with 2 orders can be rated 'Poor' and deactivated. The rules say courier delays don't count, yet customers rate 'delivery experience' and that feeds the vendor's score. There is no appeal. Source: VendorPeformance.png, database_shop.png (VENDOR_PERFORMANCE) · Raised by: C2, C3	→ REMEDY - Publish the formula: dispatch 35%, accuracy 25%, returns 15%, reviews 15%, response time 10%, measured over a rolling 90 days with at least 20 orders. - Split reviews into product, packaging and delivery, and leave delivery out of the vendor's score. Add probation and an appeal before deactivation. Implemented in Plan v2.0: §5 Vendor programme · §9 Trust, compliance and operations
F24 HIGH No vendor identity checks or staff accounts Vendor approval has no criteria: no KRA PIN, business registration, bank or M-Pesa verification, or signed agreement. VENDORS has no user_id, USERS.role is a single field, and vendor staff logins and admin sub-roles aren't designed. Source: TotalFlow.png (Vendor Onboarding), BusinessLogic_Shop.png, database_shop.png · Raised by: C1, C2	→ REMEDY - Collect KYC documents (KRA PIN, CR12, ID, bank or till details, tax compliance certificate), track kyc_status, and block payouts until verified. - Add role-based access (ROLES, USER_ROLES) and a VENDOR_USERS table, and scope every vendor query by vendor_id. Implemented in Plan v2.0: §5 Vendor programme
F25 HIGH No commission ledger, escrow or payout rules Commission and payout are fixed numbers stored on orders. Nothing records the commission rate, when vendors get paid, how money is clawed back after a return, or who pays gateway fees. Paying vendors before the return window closes leaves Obuya covering refunds it can't recover. Source: database_shop.png (commission_amount, payout_amount), BusinessLogic_Shop.png Rule 8 · Raised by: C1, C2	→ REMEDY - Add COMMISSION_RULES (by category and vendor) and an append-only VENDOR_LEDGER (SALE, COMMISSION, REFUND_CLAWBACK, PAYOUT entries). - Hold funds until delivery plus the return window, pay out weekly, and keep a 10% rolling reserve. Implemented in Plan v2.0: §4 Returns, refunds and exchanges · §5 Vendor programme

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F26 HIGH No counterfeit or licensing controls Vendors can list branded or club merchandise without proving they are licensed to sell it. Counterfeits create legal liability (for example under Kenya's Anti-Counterfeit Act 2008) and would damage the club partnership. Source: Partnership_Football.png, schools.png ('genuine products'), BusinessLogic_Shop.png · Raised by: C2	→ REMEDY - Require brand authorisation for restricted brands and club merchandise, recorded in a BRAND_AUTHORIZATIONS table. - Add notice-and-takedown, a strike system and penalties through the vendor ledger. Implemented in Plan v2.0: §5 Vendor programme · §8 Schools and club partnerships
F27 HIGH Stock stored in two places The same variant's stock lives in PRODUCT_VARIANTS.stock_qty and in INVENTORY.quantity, and INVENTORY repeats vendor_id. The two will drift apart, showing items in stock that aren't. Source: database_shop.png (PRODUCT_VARIANTS.stock_qty vs INVENTORY.quantity) · Raised by: C1	→ REMEDY Remove stock_qty from variants. INVENTORY becomes the only source of truth, and it changes only through INVENTORY_TRANSACTIONS. The vendor is derived from the product. Implemented in Plan v2.0: §5 Vendor programme

F Obuya Academy

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F28 CRITICAL Academy flow has no data model and its discount can be abused Enrolment, student ID, member discount and recommendations by age, level and programme are core to the Academy journey, but the ERD has no students, programmes, enrolments or bundles. The 15% discount is a shareable code with no caps, isn't removed when a student leaves, and is added on top of an already-reduced bundle price. The students are minors but pay for themselves. Source: Flow_academy.png, TotalFlow.png, database_shop.png · Raised by: C1, C2, C3	→ REMEDY - Add ACADEMY_PROGRAMS and ENROLLMENTS (status, level, valid_until). Apply member pricing on the server only while the enrolment is active, with no shareable code. - Set spending caps per term and one stacking rule: the better of bundle price or member discount, never both. - Use guardian accounts with linked child profiles, so a guardian consents and pays. Implemented in Plan v2.0: §6 Obuya Academy

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F29 MEDIUM Bundles and Obuya-brand gear have no owner A coach-curated bundle may contain items from several vendors, so one item out of stock breaks the whole bundle. Nobody is named as making, stocking, shipping or being rated for 'Obuya Pro' own-brand gear. Source: Flow_academy.png, Flow.png Key Notes · Raised by: C3	→ REMEDY • Make bundles virtual SKUs. Their availability is the lowest stock of any item in them, and an approved substitute is swapped in automatically. • Set up Obuya-brand products as an internal 'Obuya Brand' vendor using OBUYA_HUB fulfilment, held to the same SLA and rating as other vendors. Implemented in Plan v2.0: §6 Obuya Academy

G Obuya Foundation

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F30 CRITICAL Foundation purchases can't be recorded 'Buy for a Foundation Athlete' and 'Add a donation' have no tables. ORDERS has no purpose field, so a Foundation kit would ship to the donor. Purpose is one choice for the whole order, so a cart with 'my boots + a kit for an athlete + KSh 500' can't be placed. Donors choose sizes and items the Foundation may not need. Source: foundation_link.png, TotalFlow.png §3–6, database_shop.png · Raised by: C1, C3	→ REMEDY • Set a purpose on each cart line (Self, Foundation, Gift), with the donation as its own line. Foundation lines always ship to the Foundation hub. • Donors buy from a Foundation Needs List (items and size mix set by the Foundation) or give Kit Credit. • Add DONATIONS, FOUNDATION_STOCK, BENEFICIARIES, ALLOCATIONS and IMPACT_REPORTS. Implemented in Plan v2.0: §2 Improved customer checkout · §7 Obuya Foundation
F31 CRITICAL No governance for donation money Shop revenue and donations go through the same checkout, and the documents never name the Foundation's legal entity, how funds are kept separate, receipts, audit, or what 'a portion of proceeds' actually means. Mixing charitable and company money is a trust, tax and misrepresentation risk. Source: foundation_link.png ('Foundation Funding Sources'), TotalFlow.png §6 · Raised by: C2	→ REMEDY • Register the Foundation as its own charitable entity with a separate bank or M-Pesa account, and issue donation receipts. • Publish the exact give-back percentage for each product, plus annual audited financial and impact reports. Implemented in Plan v2.0: §7 Obuya Foundation

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F32 CRITICAL Children's photos and data collected without safeguards Impact tracking collects photos and stories of children, and the Academy collects students' ages and details. Nothing covers guardian consent, a safeguarding policy, data minimisation or access control. Kenya's Data Protection Act 2019 requires guardian consent for children's data and registration with the ODPC. Source: foundation_link.png & TotalFlow.png ('photos, stories'), Flow_academy.png · Raised by: C1, C2	→ REMEDY • Get verifiable guardian consent at enrolment and at Foundation allocation. Anonymise impact content by default. • Adopt a child-safeguarding policy with background checks for coaches and staff, appoint a DPO, register with the ODPC, store media privately behind signed URLs, and set retention limits. Implemented in Plan v2.0: §6 Obuya Academy · §7 Obuya Foundation

H Schools & Club Partnerships

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F33 HIGH Schools can't buy the way schools actually buy Schools buy with LPOs, tenders (public schools fall under PPADA 2015), board or bursar approval, 30–90 day credit terms and KRA-compliant invoices. The design gives them consumer card or M-Pesa checkout. USERS covers single people only, with no organisation, contract, quote or invoice. Source: schools.png, TotalFlow.png, foundation_link.png, database_shop.png · Raised by: C1, C2, C3	→ REMEDY • Add ORGANIZATIONS and ORG_MEMBERS with roles (requester, approver) and an approval workflow. • Build a B2B checkout: quote → pro-forma → LPO upload → invoice on account (with a credit limit) → eTIMS invoice. Support recurring orders by school term. Implemented in Plan v2.0: §8 Schools and club partnerships
F34 HIGH One-club exclusivity undermines the marketplace Banning every other Kenyan club's merchandise shuts out most football fans, contradicts the open multi-vendor model, may attract Competition Authority attention, and ties revenue to one club's form and reputation. The rule isn't in the data model, and it could accidentally block school or academy team kits. Source: Partnership_Football.png, schools.png, database_shop.png · Raised by: C1, C2, C3	→ REMEDY • Use partnership tiers instead. An 'Official Premier Partner' gets top placement and category sponsorship, and other licensed clubs can still sell. • If exclusivity is granted, make it time-limited (12 months), limited to one category and tied to performance targets, and record it in PARTNERSHIP_CONTRACTS. Never restrict school or academy kits. Implemented in Plan v2.0: §8 Schools and club partnerships

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F35 MEDIUM No numbers behind the revenue model Most non-commission revenue relies on one exclusive club. There's no unit economics: customer acquisition cost, commission after gateway fees, shipping subsidy, return costs, or the margin effect of Foundation purchases. Source: Partnership_Football.png, foundation_link.png, schools.png · Raised by: C2	→ REMEDY Build a unit-economics model for each channel (retail, academy, school, foundation, club), with a minimum take rate and a dashboard tracking it. Implemented in Plan v2.0: §8 Schools and club partnerships
F36 MEDIUM Competitor comparison can't be backed up The comparison table states things like 'No dedicated support' about named competitors without evidence, and presents Obuya's planned features as if they already exist. That is a comparative-advertising and credibility risk. Source: schools.png ('How Obuya Is Different from Jumia and Decathlon') · Raised by: C2	→ REMEDY Remove named competitors from public material. Replace the table with 'What you get with Obuya', listing only features that are live. Implemented in Plan v2.0: §8 Schools and club partnerships

I Platform, Data & Governance

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F37 MEDIUM DFD2 has orphan nodes and gaps Seven payment and order nodes have no connections. Coupon entry isn't linked to checkout, and fulfilment, returns, inventory, academy and foundation are missing entirely. The diagram can't be used as a specification. Source: DFD2.png · Raised by: C1	→ REMEDY Redraw it as a levelled DFD: level 0 (context) and level 1 (Catalog, Pricing, Cart/Checkout, Payments, Orders/Fulfilment, Returns, Promotions, Vendor Hub, Academy, Foundation, B2B, Partnerships), with every flow and data store connected. Implemented in Plan v2.0: §1 Foundational decisions

× THE FLAW IN THE CURRENT DESIGN	✓ HOW TO OVERCOME IT
F38 MEDIUM Product reviews not modelled or verified Customers are said to review products and vendors, but only VENDOR_RATINGS exists. It isn't limited to verified buyers or one review per order, and nothing covers moderation. Source: Flow.png step 14, BusinessLogic_Shop.png §7, database_shop.png · Raised by: C1	→ REMEDY • Add PRODUCT_REVIEWS, one per delivered order line (unique), with media and a moderation status. Allow a vendor rating only after a delivered sub-order. Implemented in Plan v2.0: §9 Trust, compliance and operations
F39 HIGH No consent, legal terms, audit trail or idempotency Promotional emails and SMS go out with no opt-in, and there's no Terms of Service, privacy policy or vendor agreement. Stock adjustments, price changes and grievance decisions leave no audit trail, and payment webhooks have no idempotency protection. Source: TotalFlow.png, Flow.png, database_shop.png, InventoryManagement_flow.png · Raised by: C1, C2	→ REMEDY • Add a CONSENTS table (version, timestamp), a separate marketing opt-in, unsubscribe links, and notification channel preferences. • Add AUDIT_LOGS (actor, before, after) and IDEMPOTENCY_KEYS for payment and webhook calls. Implemented in Plan v2.0: §2 Improved customer checkout · §5 Vendor programme · §9 Trust, compliance and operations
F40 MEDIUM Admin bottleneck, 'always available' support and heavy UX Needs assessments, proposals, vendor approvals, coupons, grievances and return coupons all rely on an admin working by hand. Human support is promised 'always', with no hours or response target. The design doesn't consider low bandwidth or mobile-first use in Kenya. Source: TotalFlow.png (chatbot, 'always available'), schools.png, BusinessLogic_Shop.png §2 · Raised by: C3	→ REMEDY • Automate routine rules, and give admins work queues with response targets. Publish support hours (bot 24/7, human 8 am–8 pm EAT, first reply under 2 hours) with a WhatsApp or SMS fallback. • Design mobile-first and lightweight (a PWA with compressed images), and let users choose WhatsApp, SMS or email for notifications. Implemented in Plan v2.0: §4 Returns, refunds and exchanges · §9 Trust, compliance and operations
